

# **ROLE OF THE TEMPERATURE AND PRECIPITATION ACTIVE PERIODS FOR ASSESSMENT OF CLIMATE TRENDAL INFLUENCE ON SCOTS PINE**

Mg.silv., lect. Solveiga Luguza

Dr.habil.biol., prof. Imants Liepa

Jelgava  
16.05.2012.

# Aim and tasks of research

## AIM

- elaboration of methodology of impact structure of temperature and precipitation on radial increment of Scots pine *Pinus sylvestris* L.

## TASKS:

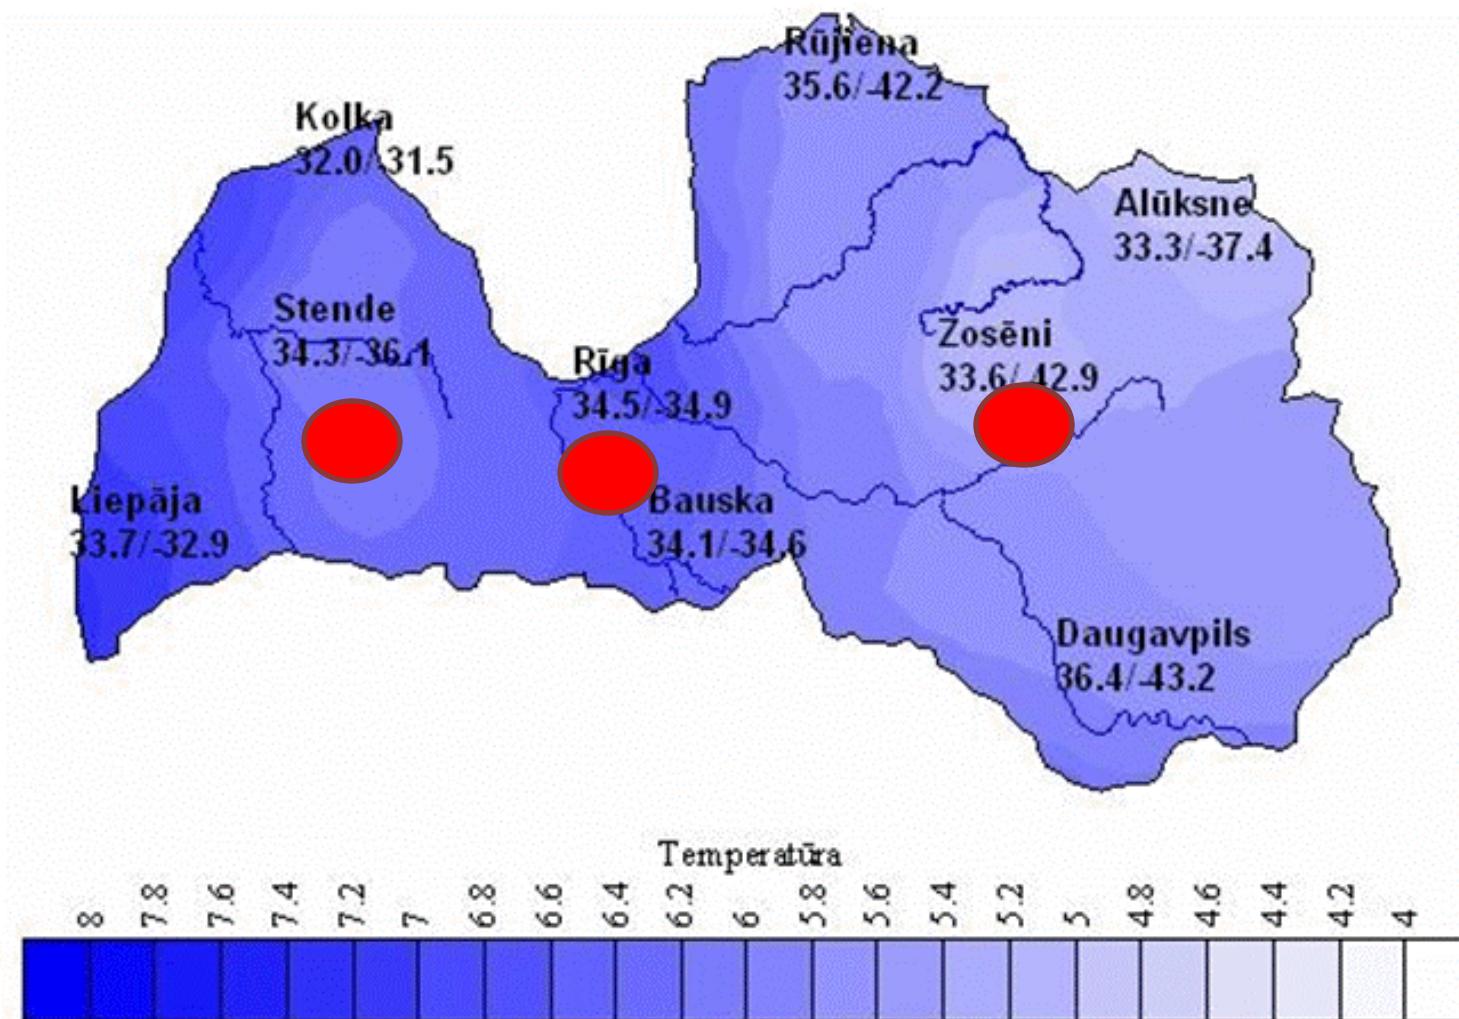

- to clarify if annual temperature (maximal and minimal) change initiate response reaction of annual tree-ring width;
- if radial increment follow the temperature change, is there any connection between it and precipitation level

# Possibilities of provement:

- a) direct relation of metheorogical factors and tree-ring width (regression analysis);
- b) tree active growth period trendal shift

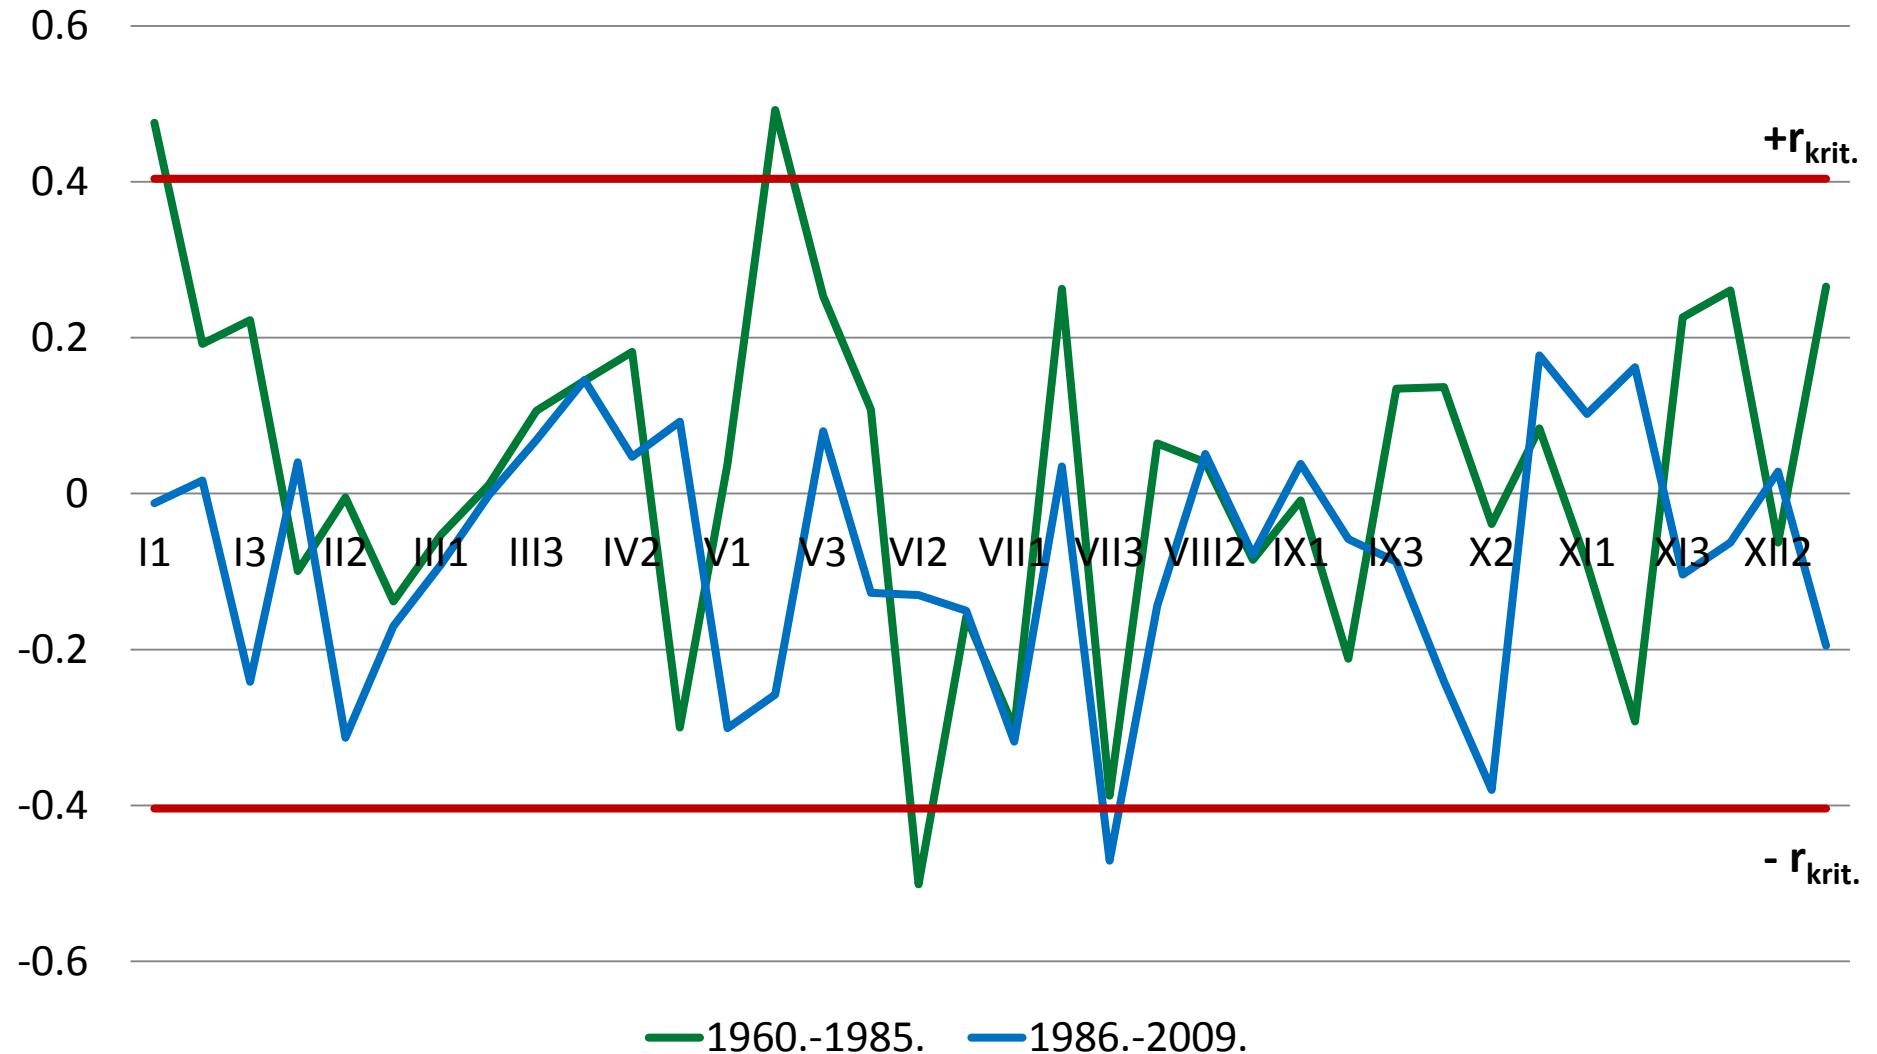

# Methodology of research (1)

Annual **mean** temperature and absolute **min** and **max** temperatures and location of sample plots

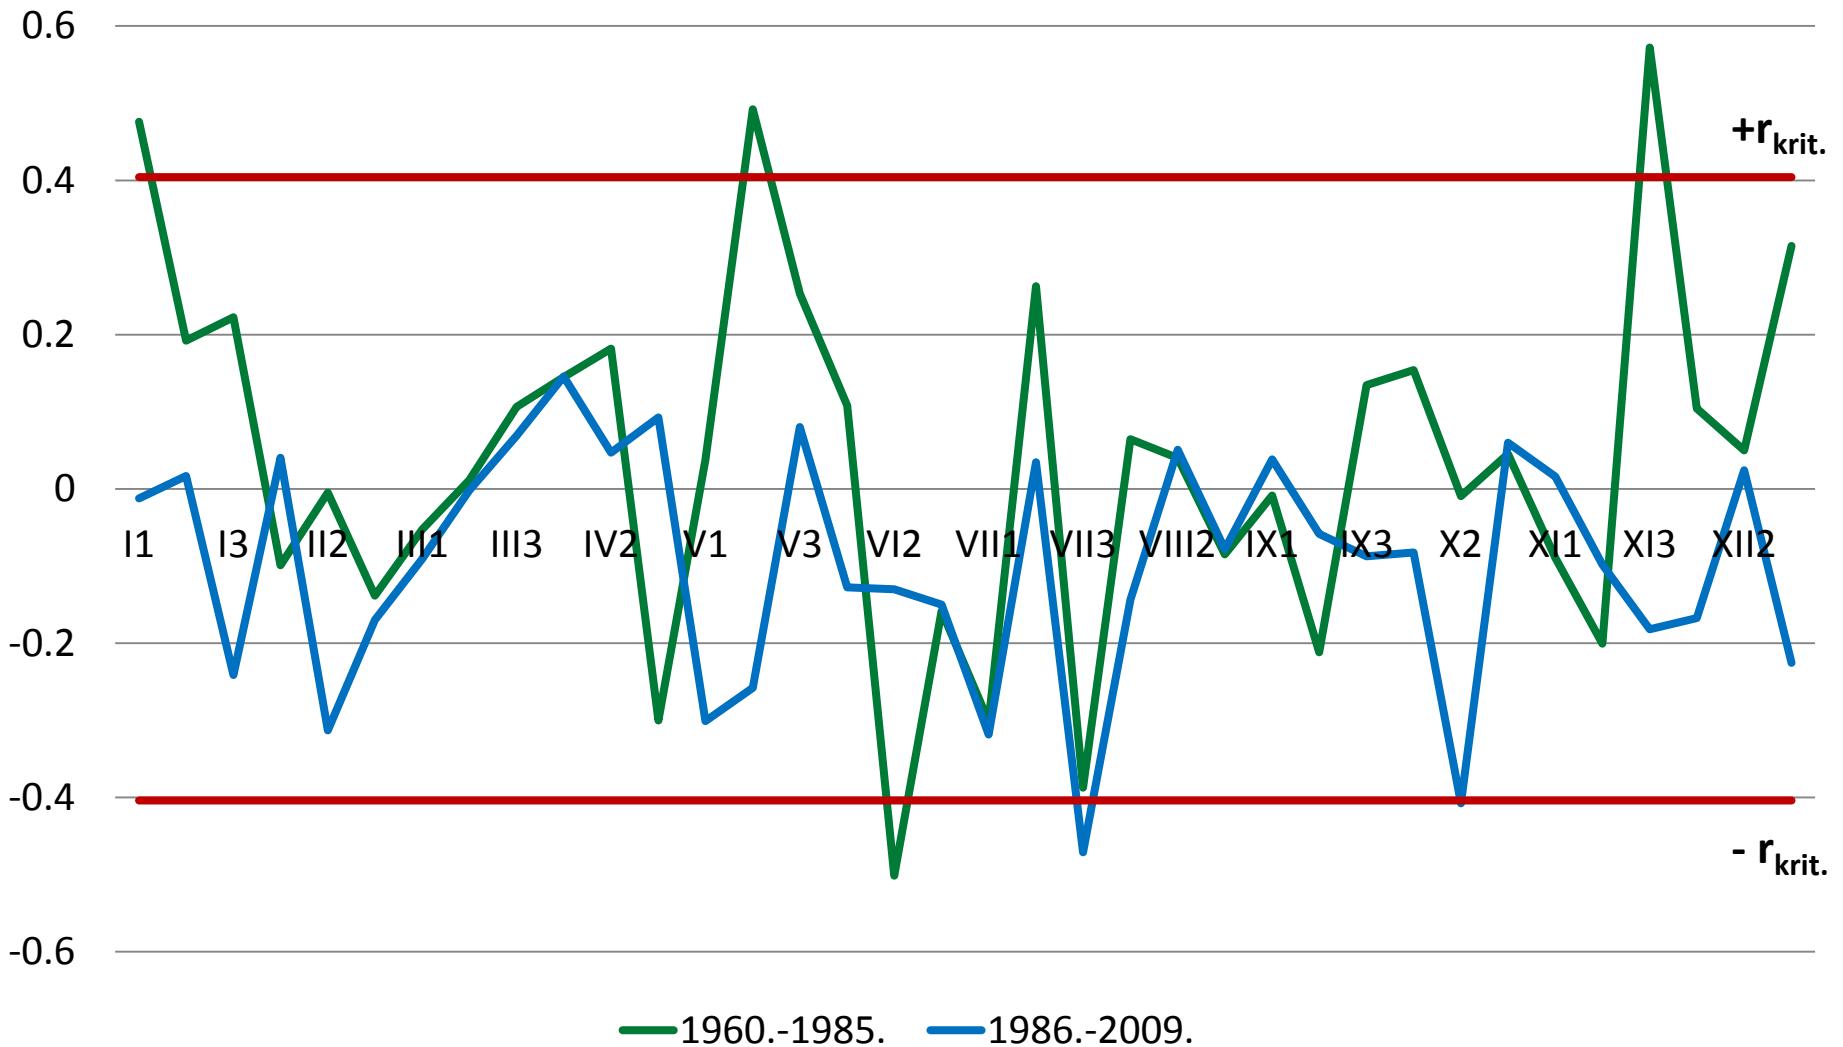

# Maximal temperature

Active periods of current year

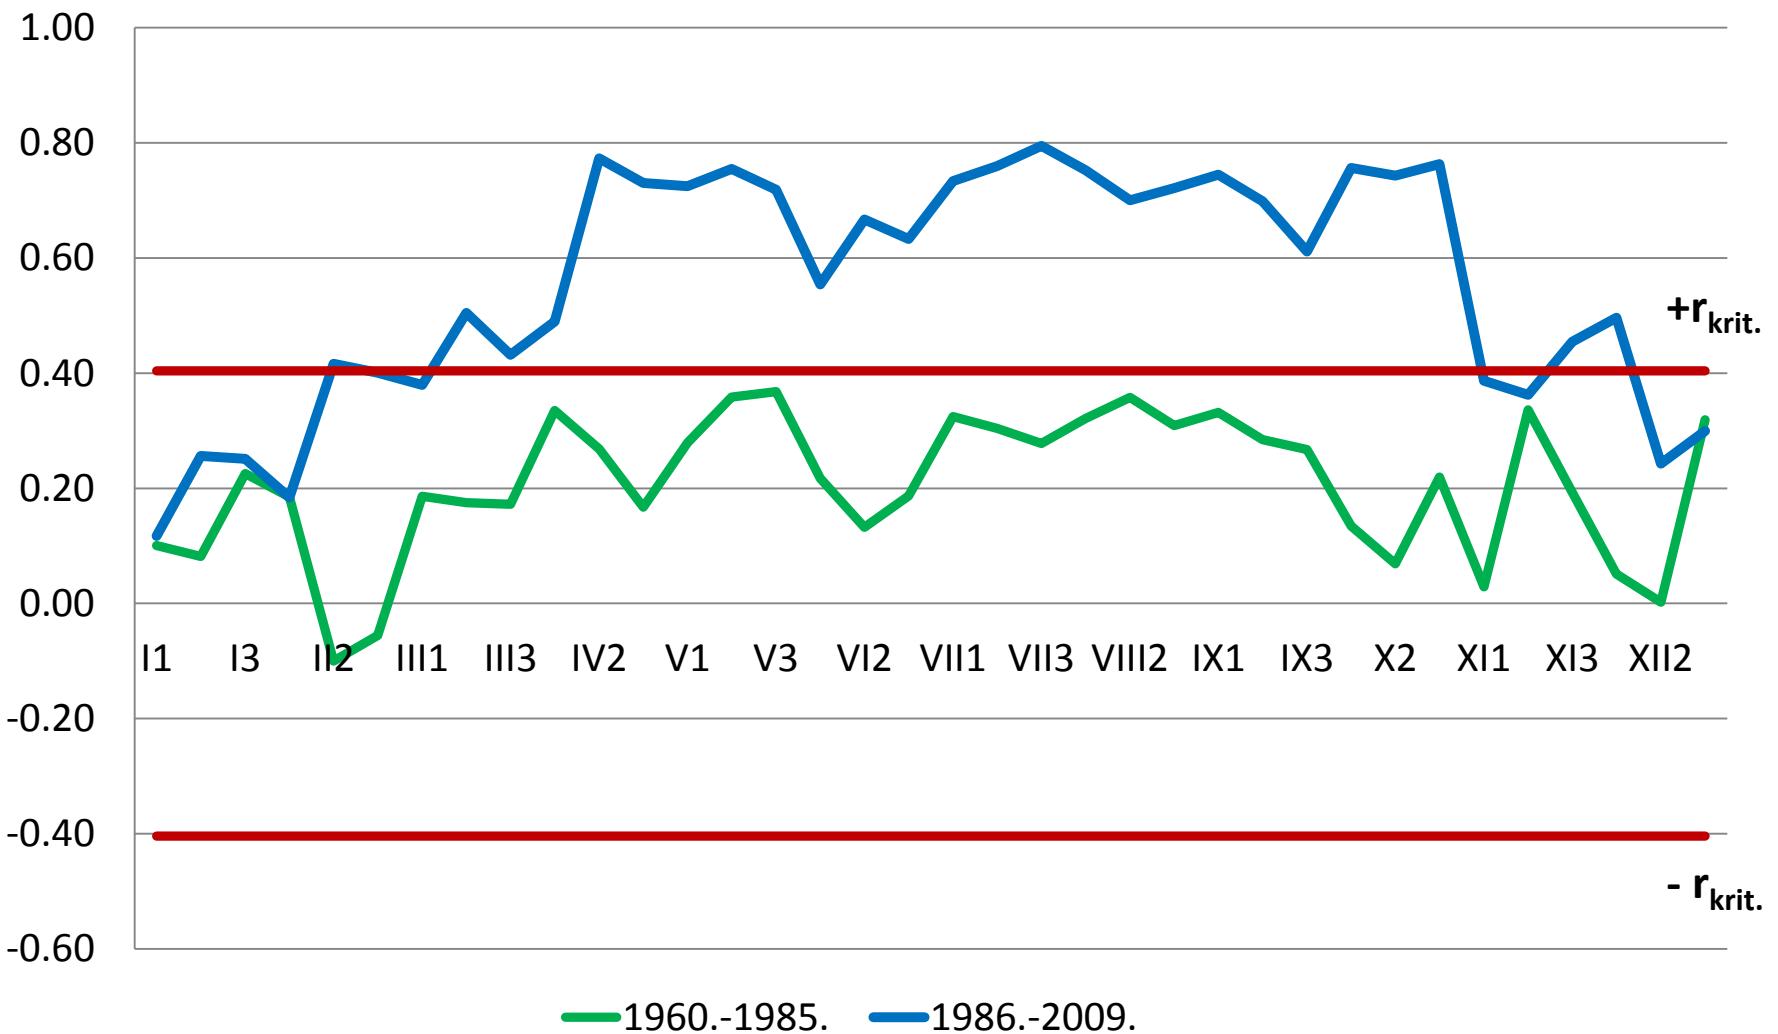

# Maximal temperature

Active periods of previous year (biological inertia 1 year)

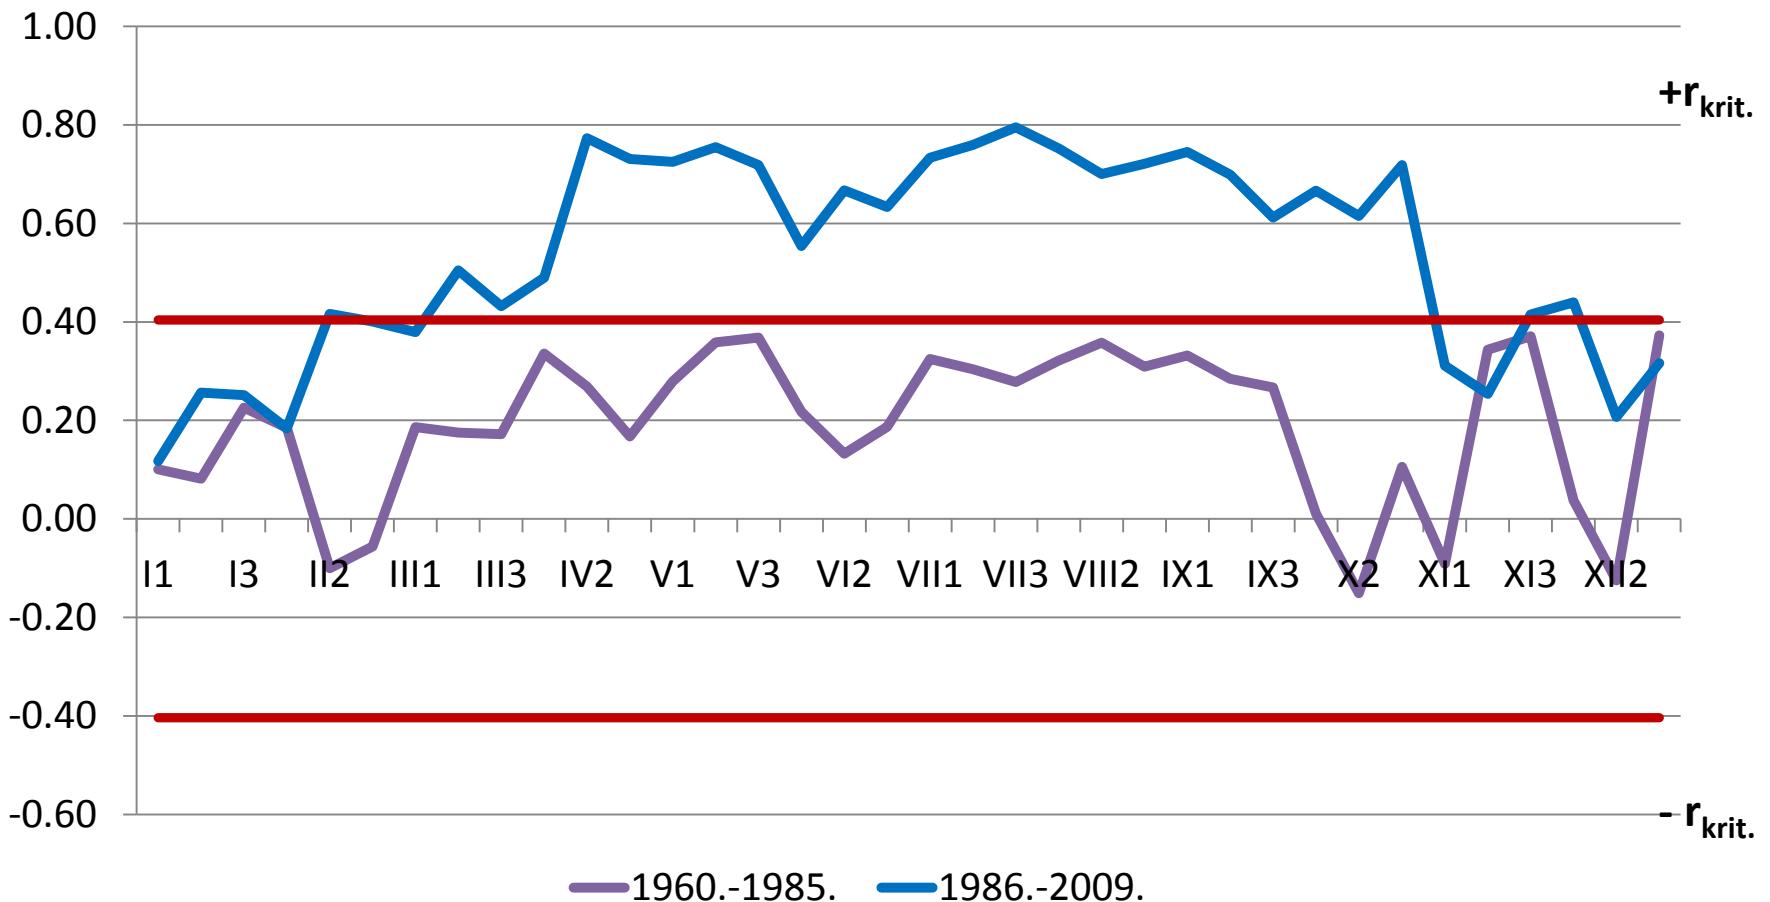

# Minimal temperature

Active periods of current year

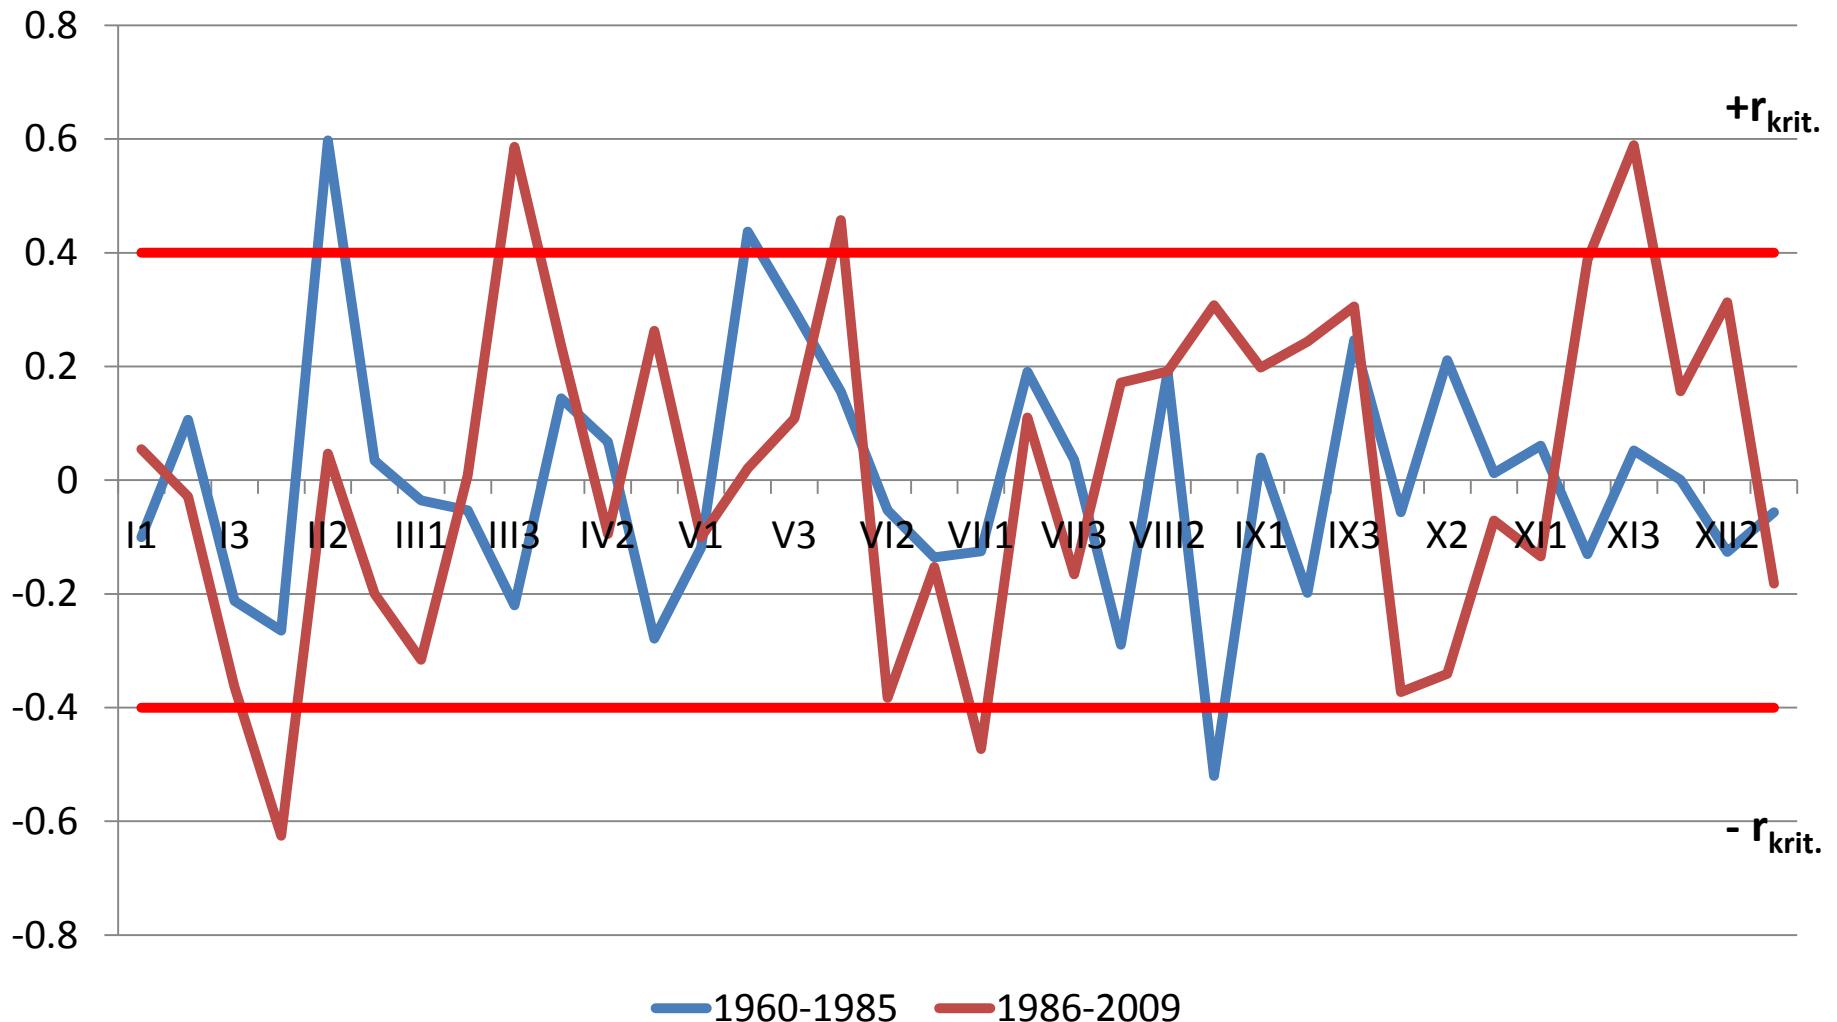

# Minimal temperature

Active periods of previous year (biological inertia 1 year)

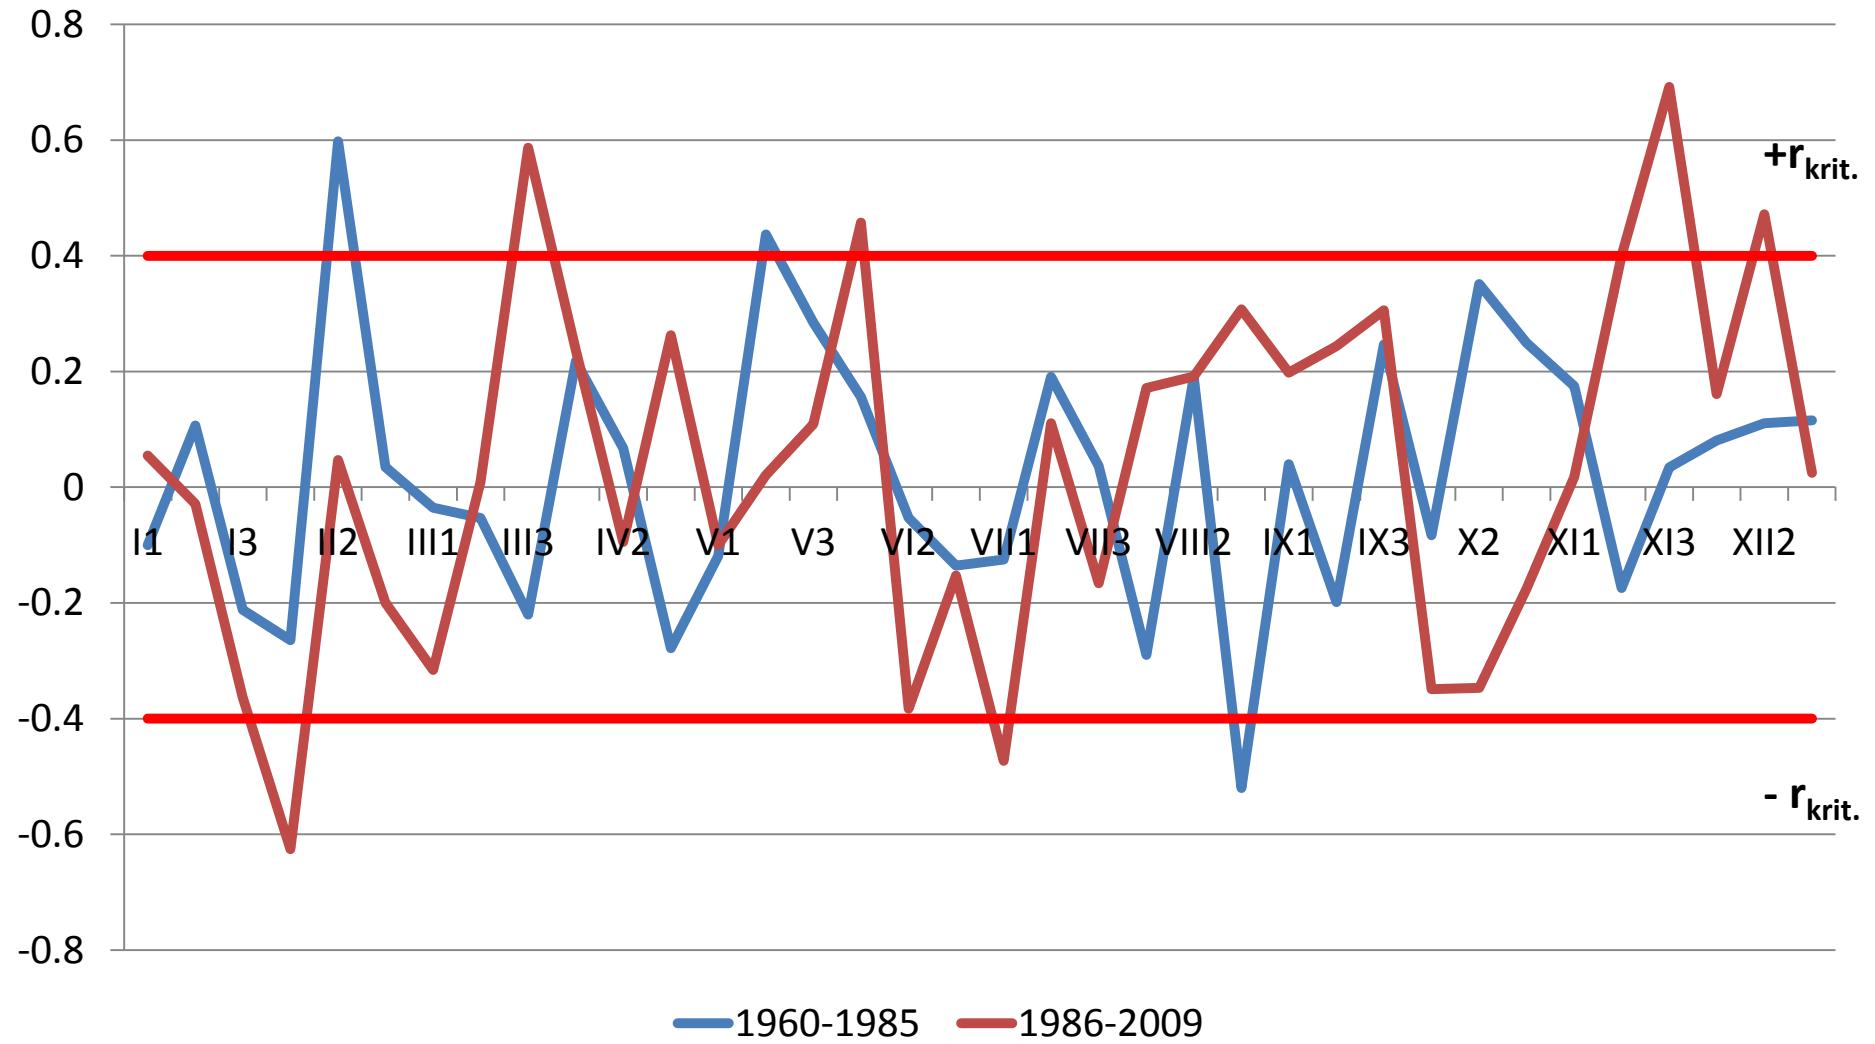

# Precipitation

Active periods of current year

# Precipitation

Active periods of previous year (biological inertia 1 year)

# Acknowledgements

This research was funded by the **European Regional Development Funds project** ‘The support system of planning and decision making for the sustainable forest management’ (State Education Development Agency, Latvia University of Agriculture, contract number:  
2010/0208/2DP/2.1.1.0/10/APIA/VIAA/146)

# THANK YOU!
